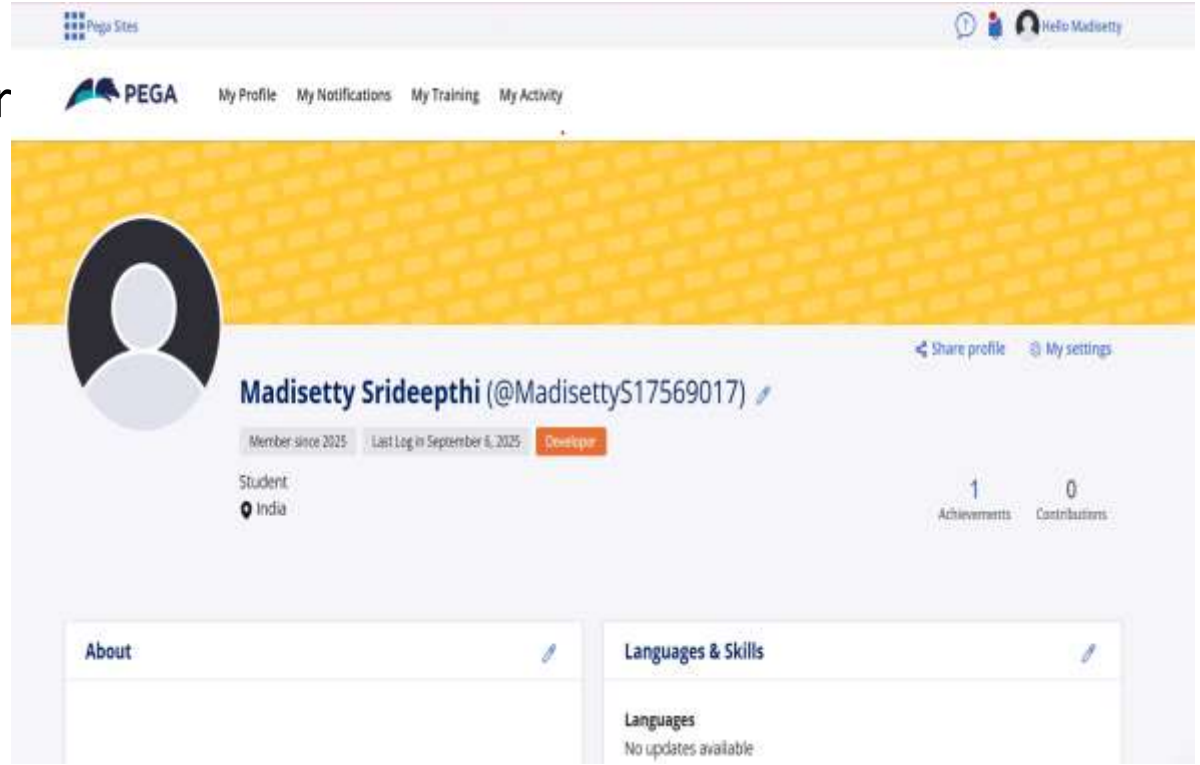
Introduction to the Pega Platform

The Pega Platform is a low-code platform used to build, deploy, and manage enterprise-level applications, focusing on business process management (BPM) and customer relationship management (CRM).

How to navigate to the Pega platform:-

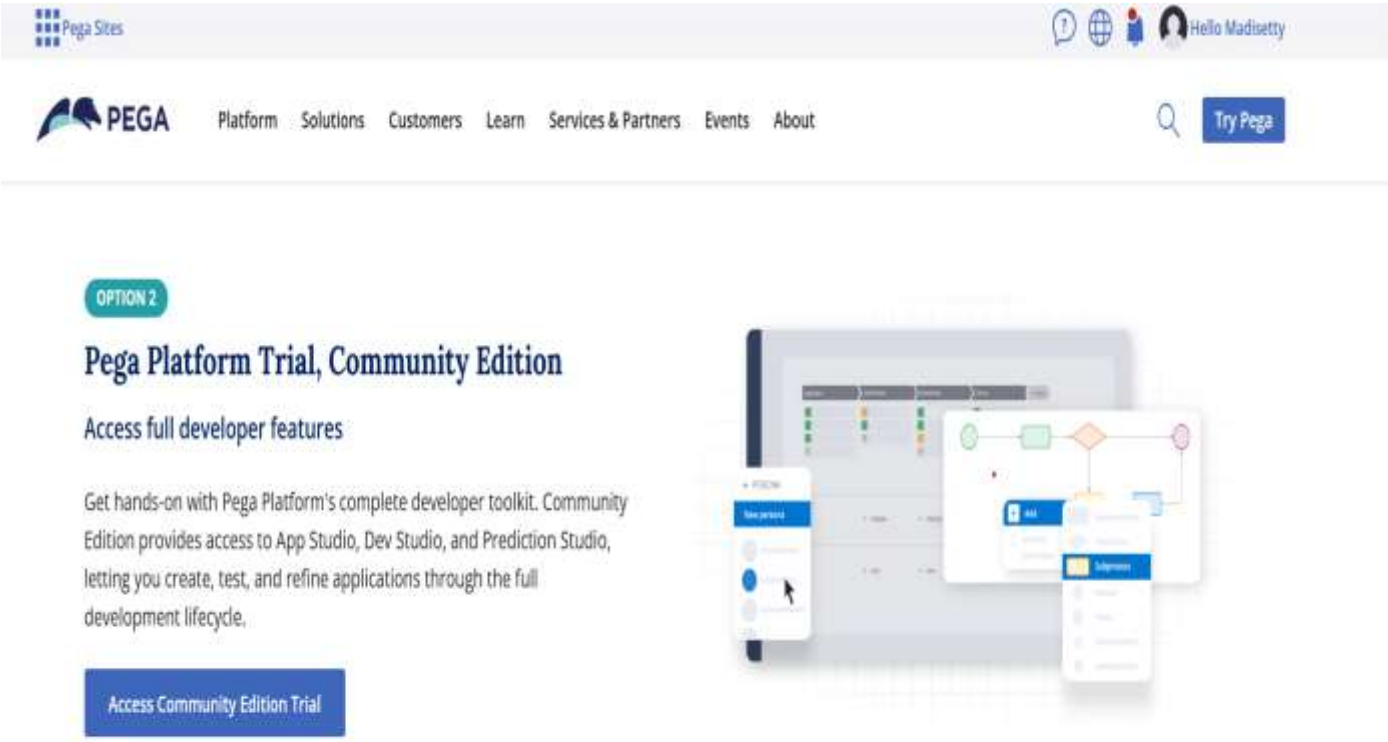
- Go to https://academy.pega.com/? , sign up
- And log in to Pega Academy, it replicates your Page as in the given image.
- Now go to pega.com/platform-trial?

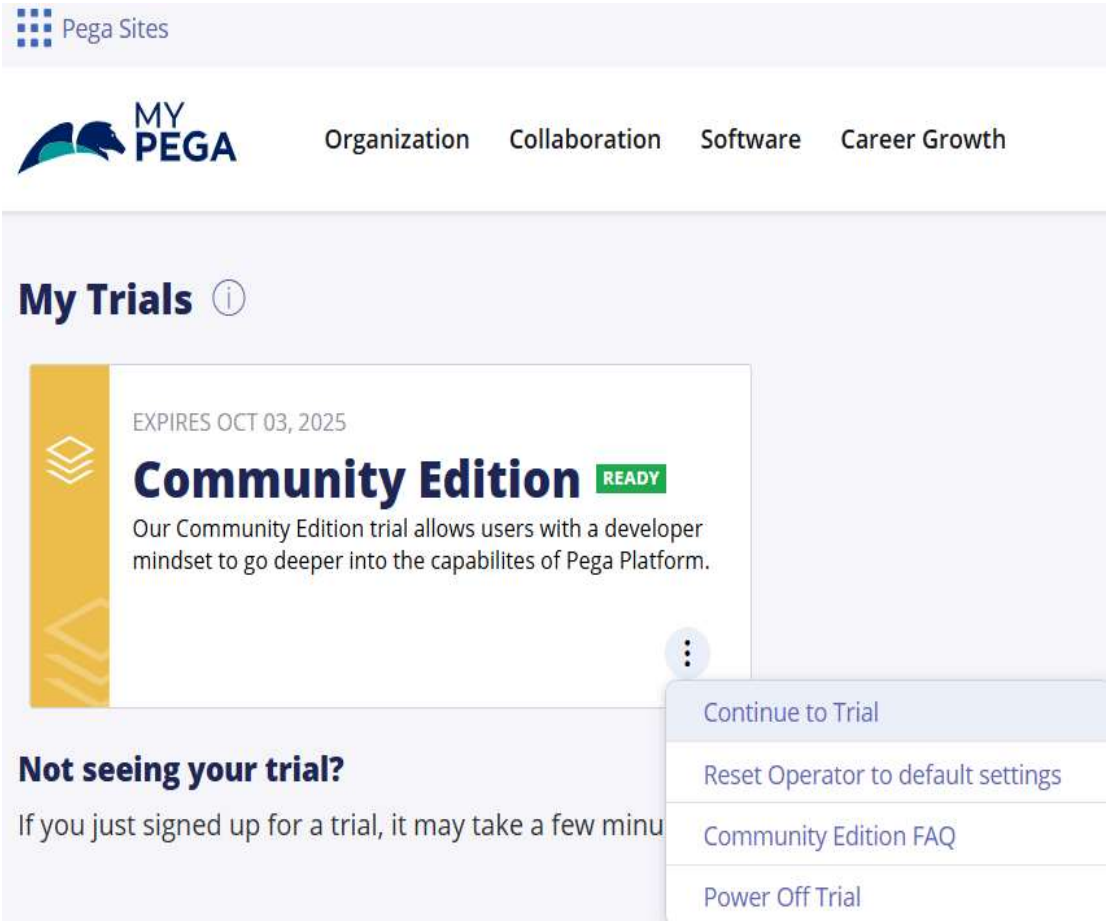
Pega provides a trial section that can enhance the user experience and the trial section end in a month out, the user can renew their trial.



- Now click on “Access Community Edition Trial”

It takes a few minutes to give you a pop-up message and continue it by clicking the “MY TRIALS”





- Now click on the three dots symbol and click on “continue to trial.”, While entering the trial, it takes a few seconds to load the page

This is Pega Studio, where an application can be built and deployed.

Pega GenAI™ Blueprint

Extend your application

Import Case Types, Data Objects, or Personas into your existing Application from a Blueprint.

Import a Blueprint

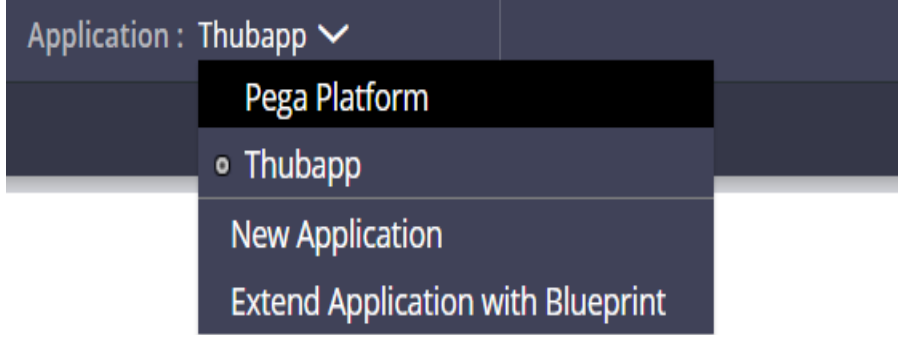
Design for the future

Export your existing Application as a Blueprint to design the future of your workflow Application.

Export as Blueprint

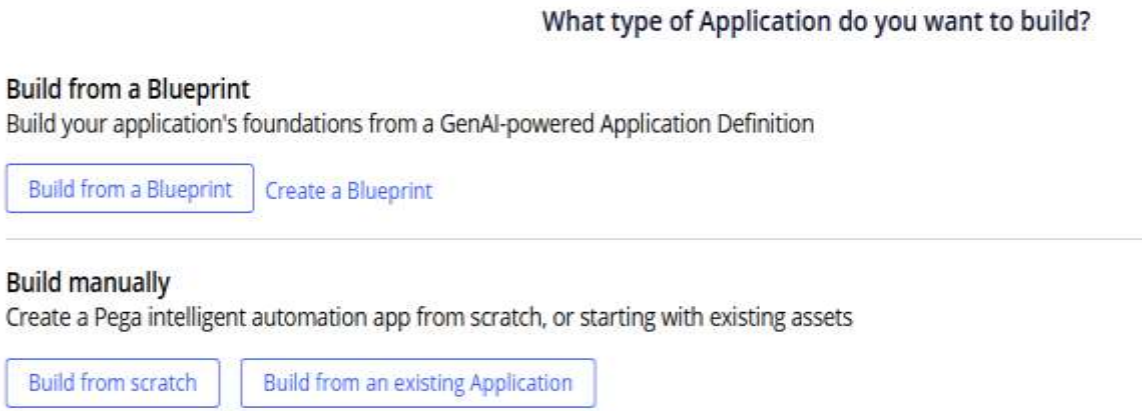
Application layers

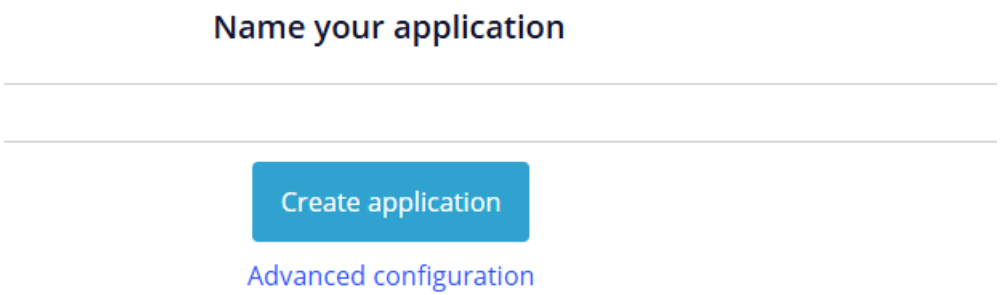
- In this, we have mainly three studios
  APP STUDIO:- We build an application
  DEV STUDIO:- It is a development studio
  PREDICTION STUDIO:-It is used for AI and predicting applications.

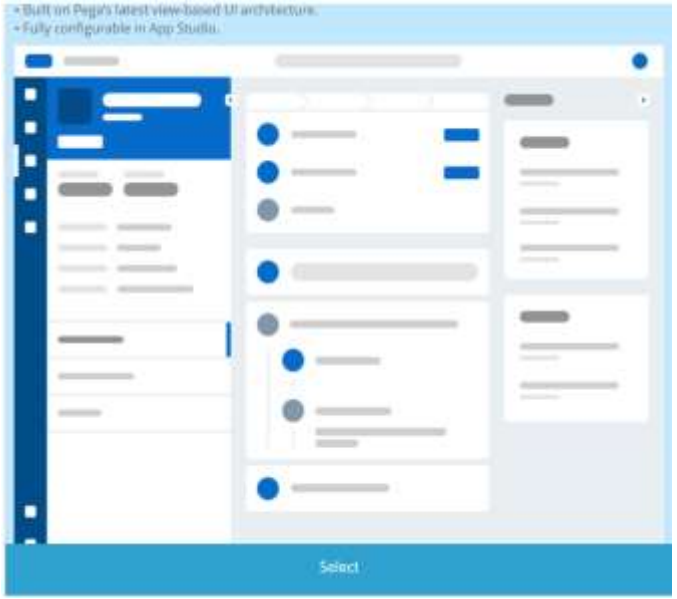


❖ Create a New Application

- Click on “New application”
- Move to “Build from scratch”
- Click on “select”





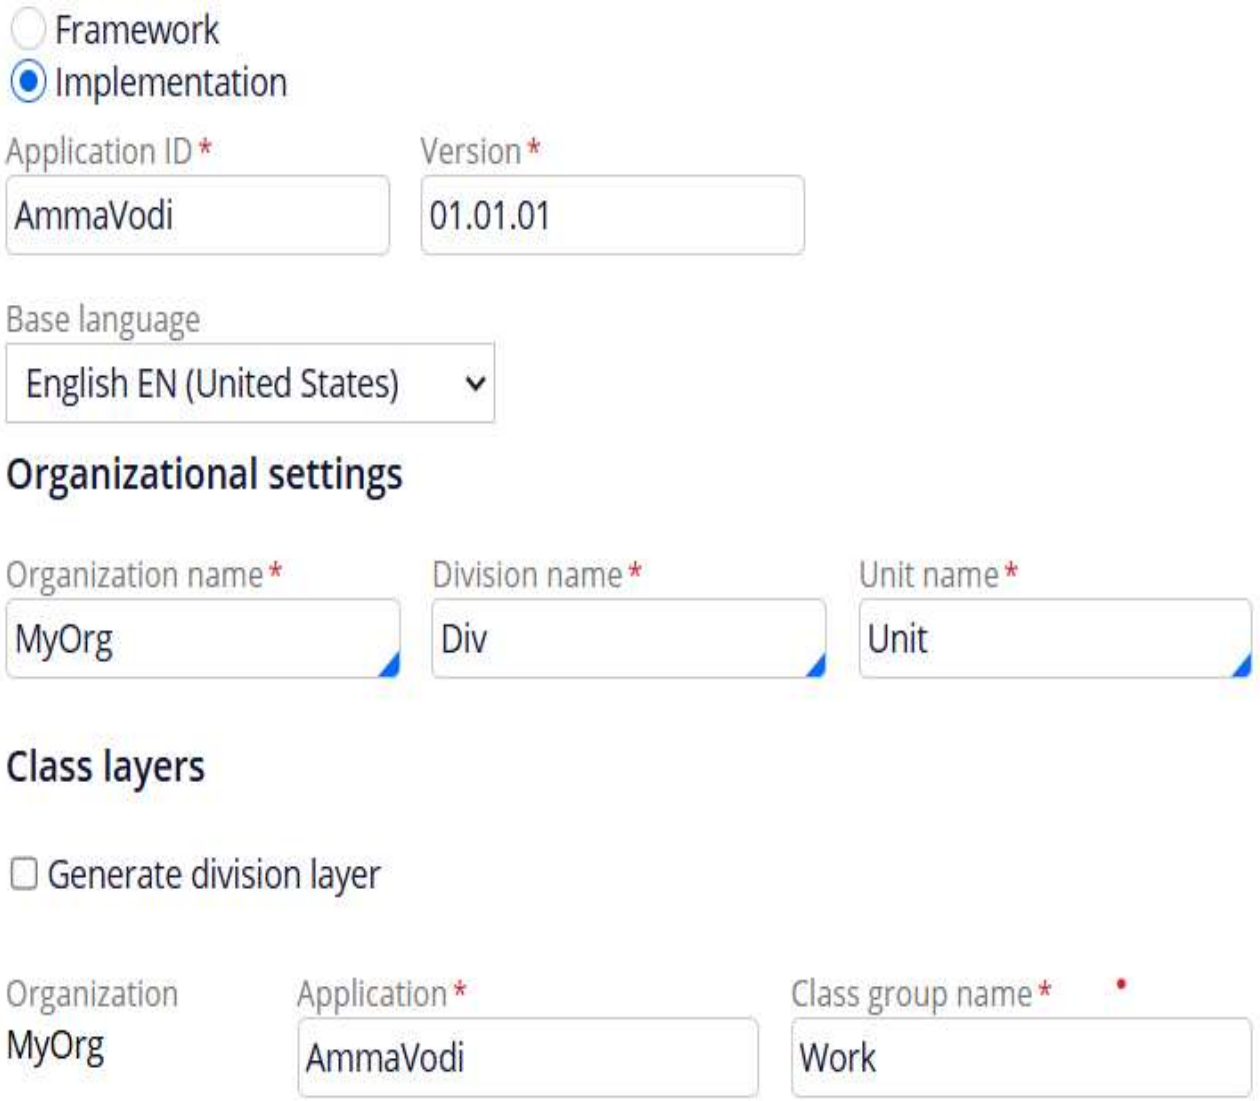


- By directly giving the name of the application, just click on the “Advanced configuration”

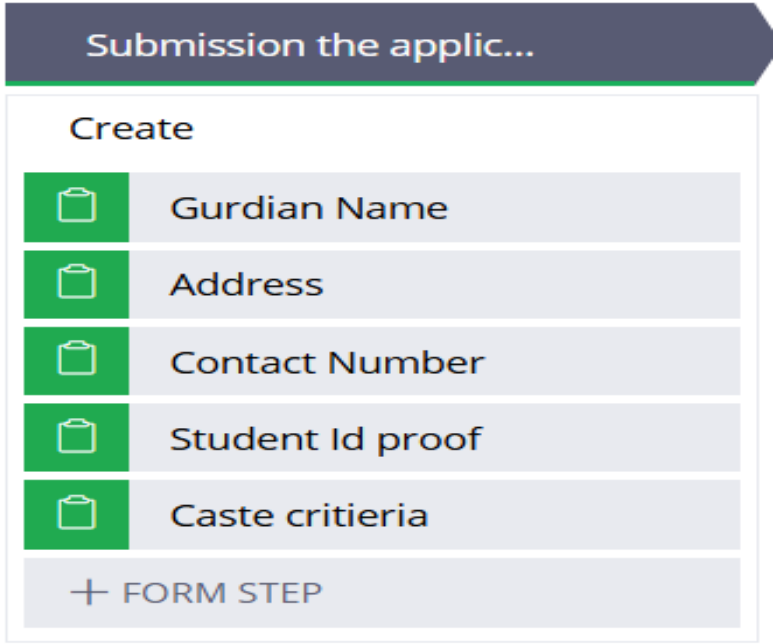
- Now, click on “Implementation” and give your optional application ID, and click on “Create Application”
- “Go to New Application”

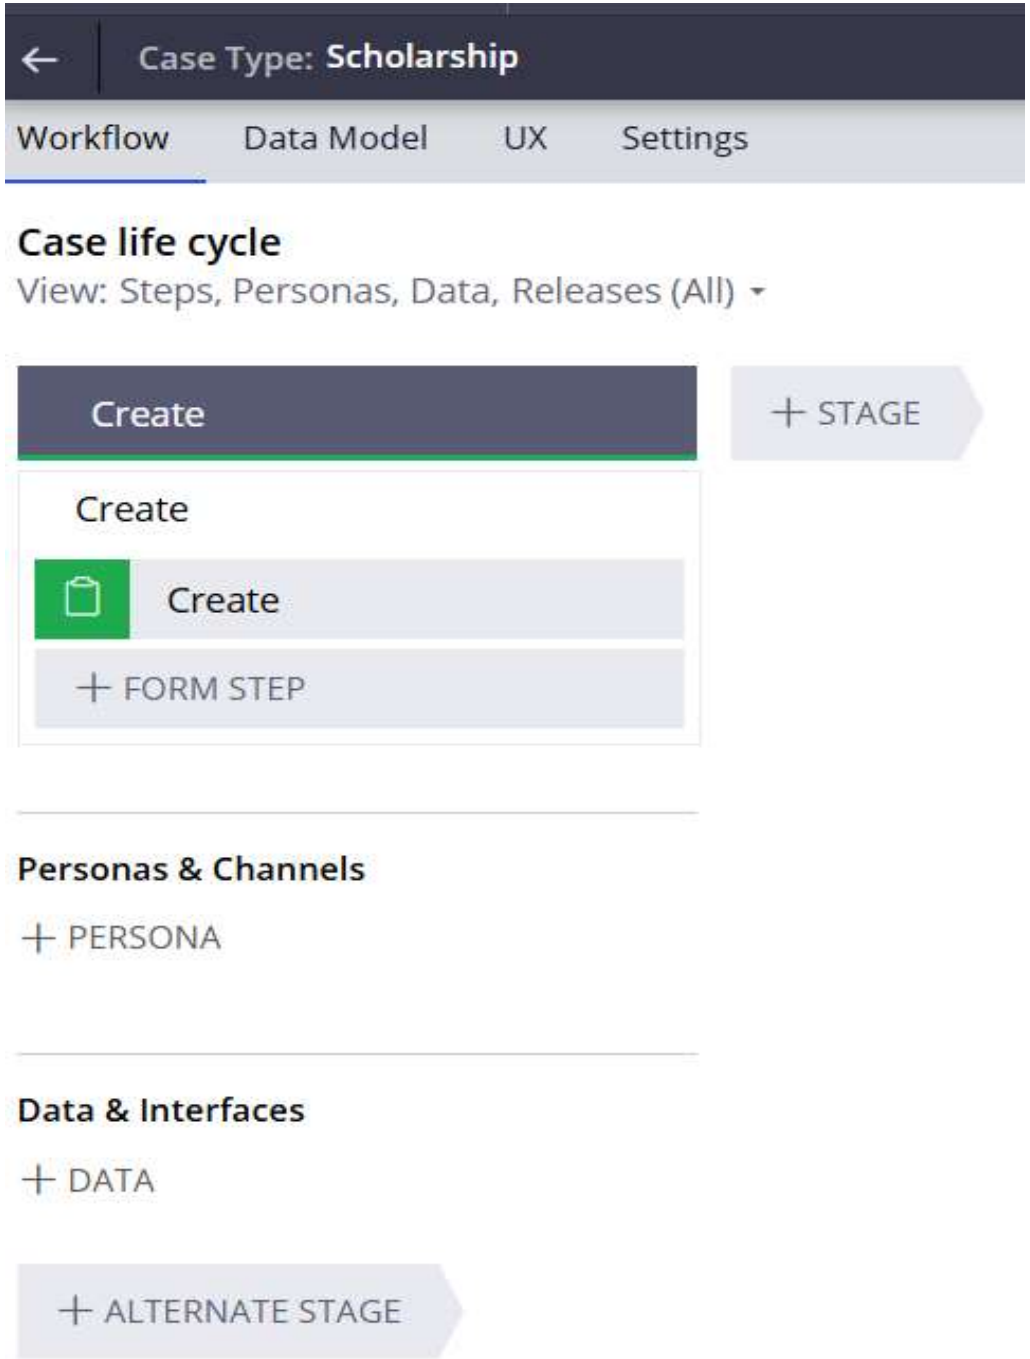
❖ Creating a Case Type

- A “**case type**” that is a template for a specific process, defining the stages and steps a case will go through from end to end.
- Create a case type by using “standard template” and give a name to the case type.

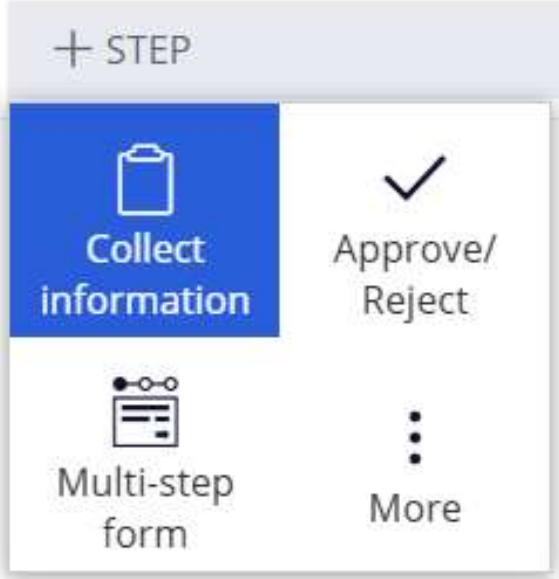


- After creating a case type, it shows the case life cycle page as shown in the figure.
- It provides us with a default stage “Create”, and you can’t delete or change the place on the default stage. By clicking on the ‘+’ icon, you can add new stages, and you can delete or replace it.
- Add step to case type by clicking on “+ form step” to add more step
- Add steps as given in the figure





- While creating a step, we have to choose the type of information as shown in the figure

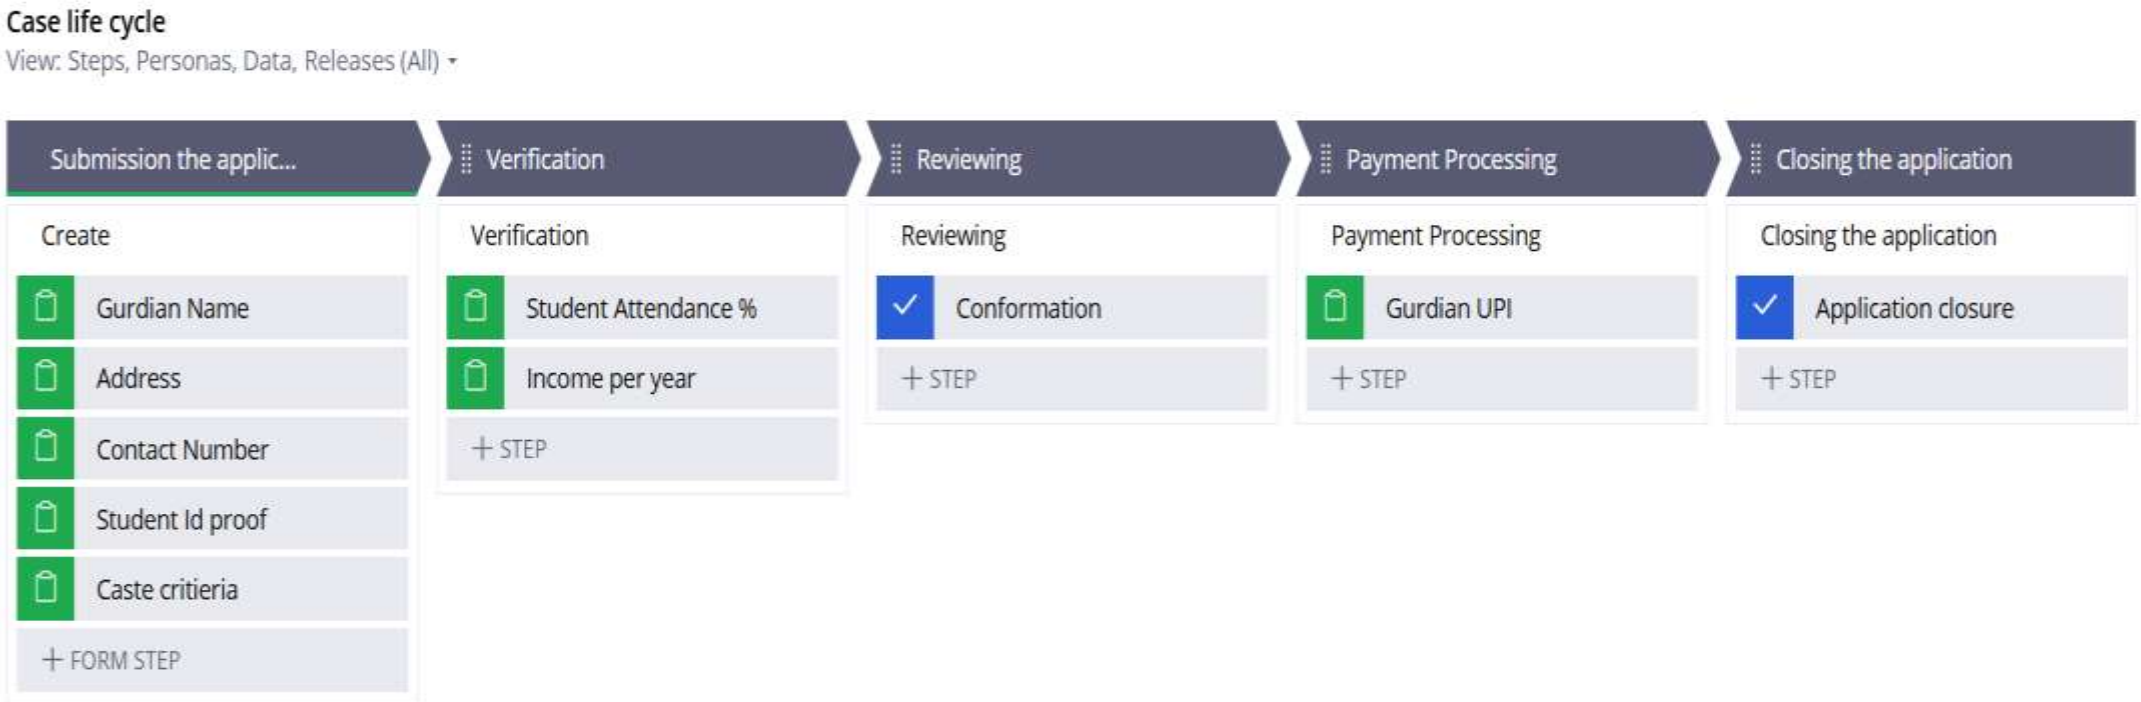


Collect information: It is used when we have to obtain information from users, like name, age, date of birth, etc. (it is indicated in green)

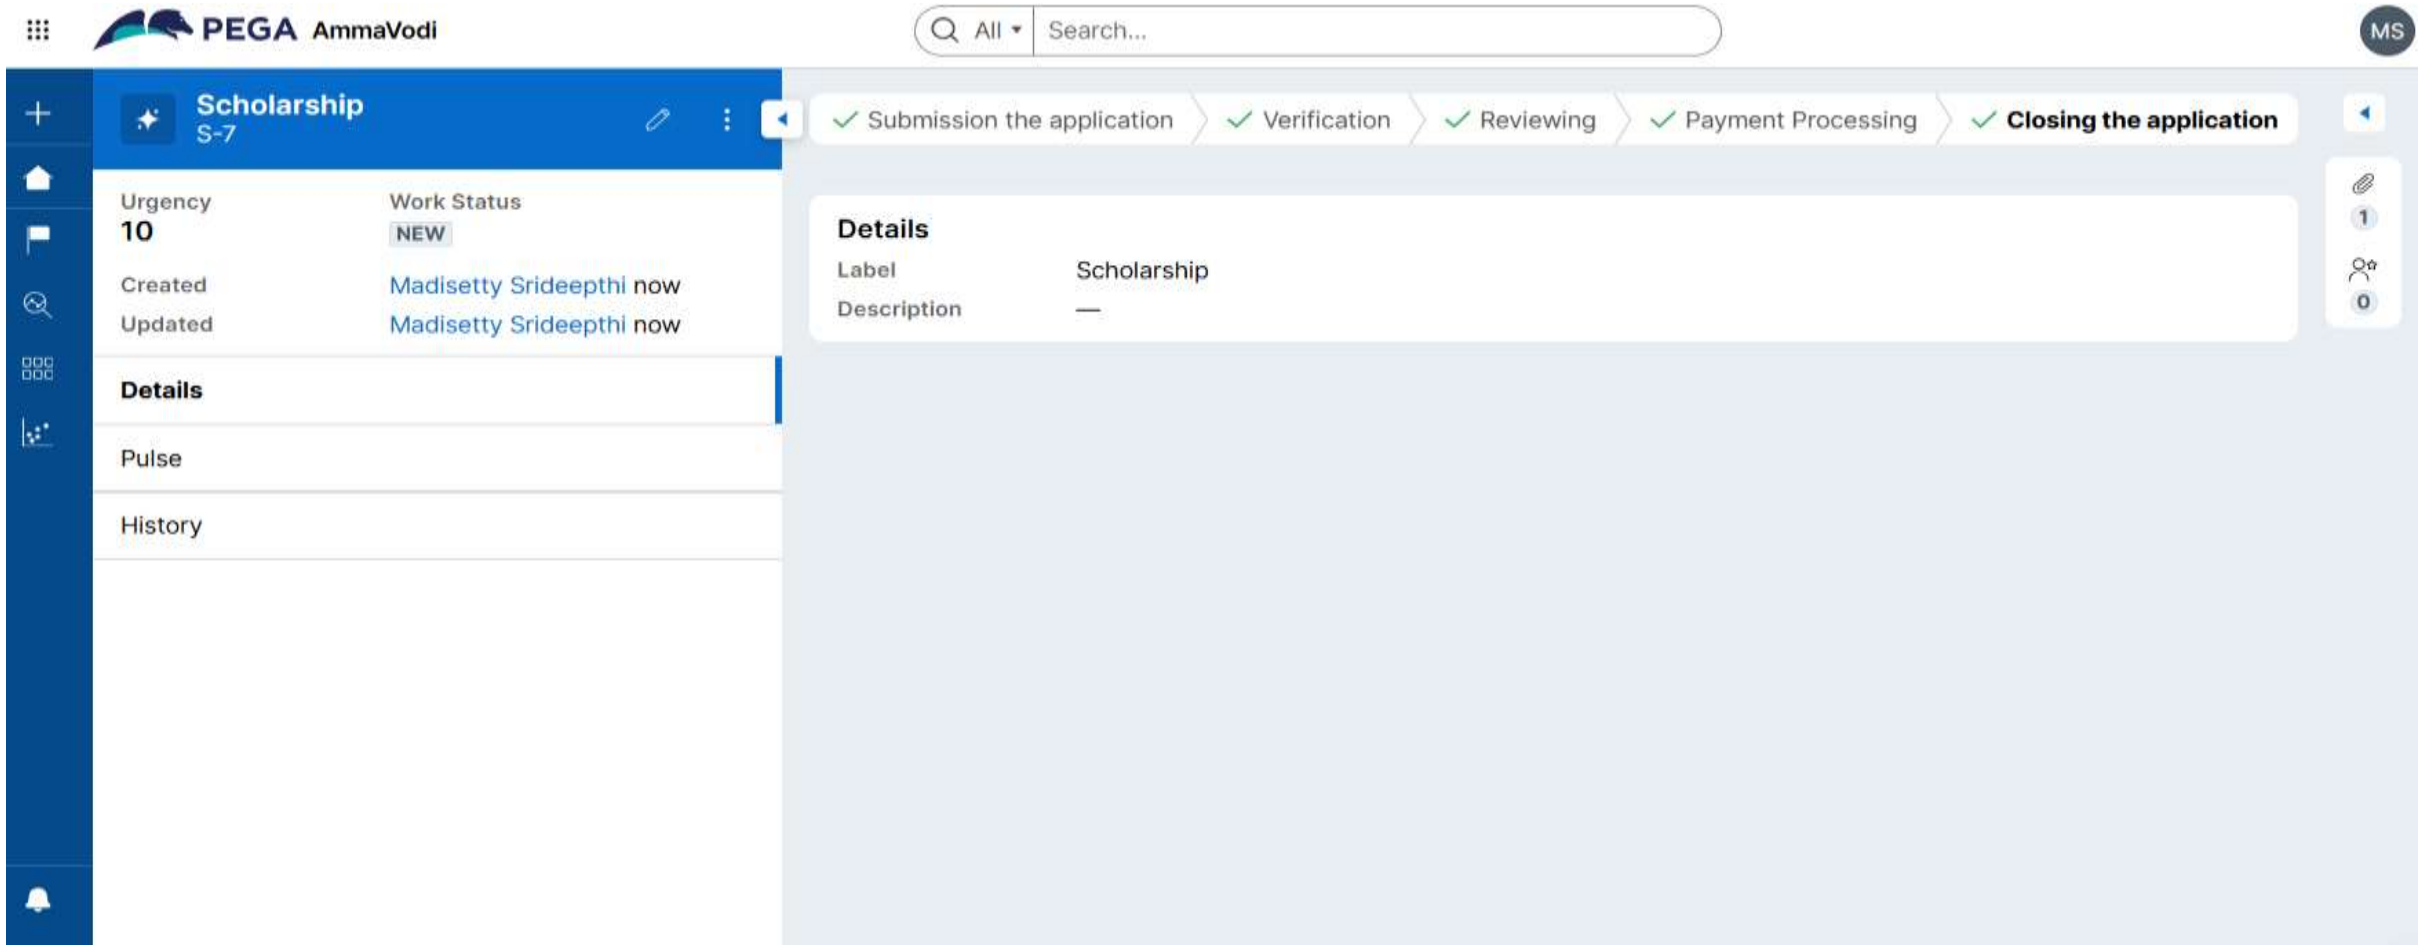
Approve/Reject: where we have to approve or reject the application (it is indicated in blue)

Multi-step form: A Group of multi-step at a time.

More: If we have to send an email about the status of the application of users. (it is indicated in yellow)



❖ Testing the case type

- Save the Scholarship case type and click on “save and run “
- Click on next, next, next, next, Advance the case, Advance this case, Advance this case, Approve, Advance this case, Approve. After completing these steps, the case type “Scholarship” has been successfully configured.


FINAL OUTPUT:-
